

Abstract

The invention concerns a composition comprising, in a cosmetically acceptable aqueous medium, at least 0.02 wt. % relative to the composition total weight, one or several water-soluble organic silicon compounds, containing at least two or three silicon atoms, at least a basic chemical function, and at least two hydroxyl or hydrolysable groups per molecule, and at least 4 wt. % relative to the composition total weight, of a detergent surfactant selected among the anionic, non-ionic, amphoteric surfactants and their mixtures. The invention is useful for producing shampoos.
